Auctions with a multi-member bidder

Auctions with a multi-member bidder

- ▶ Works in auction theory typically assume that bidders are individual agents (firms, organizations, persons).

Auctions with a multi-member bidder

- ▶ Works in auction theory typically assume that bidders are individual agents (firms, organizations, persons).
- ▶ In practice, they are often not.

Auctions with a multi-member bidder

- ▶ Works in auction theory typically assume that bidders are individual agents (firms, organizations, persons).
- ▶ In practice, they are often not.
- ▶ Examples:
 1. Spectrum auctions;
 2. A couple of roommates jointly bidding on a TV set.

Auctions with a multi-member bidder

- ▶ Works in auction theory typically assume that bidders are individual agents (firms, organizations, persons).
- ▶ In practice, they are often not.
- ▶ Examples:
 1. Spectrum auctions;
 2. A couple of roommates jointly bidding on a TV set.
- ▶ Economic characteristics:
 1. Public good;
 2. Aggregation problem in a strategic bidding setting.

Literature

Literature

- ▶ Team play: Duggan 2001, Kim et al. 2021.

Literature

- ▶ Team play: Duggan 2001, Kim et al. 2021.
- ▶ Auctions for patents: Asker et al. 2021.

Literature

- ▶ Team play: Duggan 2001, Kim et al. 2021.
- ▶ Auctions for patents: Asker et al. 2021.
- ▶ Collusion - a cartel is a “bidding team.”
E.g., McAfee and McMillan 1992, Mailath and Zemsky 1991,
many more.

- ▶ Collusion - a cartel is a “bidding team.”
E.g., McAfee and McMillan 1992, Mailath and Zemsky 1991,
many more.
- ▶ Group contests - the group/team wins together or loses together. E.g., Kobayashi and Konishi 2021.

Model

- ▶ Auction with two bidders.

Model

- ▶ Auction with two bidders.
- ▶ Bidder A consists of n symmetric individuals: players $1, \dots, n$.
Type dist - F on $[0, 1]$.

Model

- ▶ Auction with two bidders.
- ▶ Bidder A consists of n symmetric individuals: players $1, \dots, n$.
Type dist - F on $[0, 1]$.
- ▶ Bidder B is a single agent, player $n + 1$ (the regular bidder).
Type dist. on \mathbb{R}_+ according to the CDF G .

$$\theta_i - p_i,$$

where $\sum_{i=1}^n p_i = \text{cost}$

- ▶ Team mechanism = bid aggregation rule (A) and cost sharing rule (s).

Second-price auctions

Second-price auctions

- ▶ Let (A, s) be a mechanism.

Second-price auctions

- ▶ Let (A, s) be a mechanism.

$$\begin{aligned}\Pi_i^{(A,s)} &\equiv G(A(b_1, \dots, b_n)) \times \\ &\times [\theta_i - s_i(b_1, \dots, b_n) \cdot \mathbb{E}(\theta_{n+1} : \theta_{n+1} \leq A(b_1, \dots, b_n))].\end{aligned}$$

Second-price auctions

- ▶ Let (A, s) be a mechanism.

$$\begin{aligned}\Pi_i^{(A,s)} &\equiv G(A(b_1, \dots, b_n)) \times \\ &\times [\theta_i - s_i(b_1, \dots, b_n) \cdot \mathbb{E}(\theta_{n+1} : \theta_{n+1} \leq A(b_1, \dots, b_n))].\end{aligned}$$

- ▶ **Theorem**

If $\{\Pi_i^{(A,s)}\}_{i=1}^n$ are continuous, then the game has an equilibrium.

Second-price auctions

- ▶ Let (A, s) be a mechanism.

$$\begin{aligned}\Pi_i^{(A,s)} &\equiv G(A(b_1, \dots, b_n)) \times \\ &\times [\theta_i - s_i(b_1, \dots, b_n) \cdot \mathbb{E}(\theta_{n+1} : \theta_{n+1} \leq A(b_1, \dots, b_n))].\end{aligned}$$

- ▶ **Theorem**

If $\{\Pi_i^{(A,s)}\}_{i=1}^n$ are continuous, then the game has an equilibrium.

- ▶ **Theorem**

There does not exist a mechanism that leads to an efficient allocation.

First-price and all-pay auctions

First-price and all-pay auctions

- ▶ Notation: $\Gamma^{FPA}(A, s)$, $\Gamma^{APA}(A, s)$.

First-price and all-pay auctions

- ▶ Notation: $\Gamma^{FPA}(A, s)$, $\Gamma^{APA}(A, s)$.
- ▶ *Equilibrium with complete free riding*: $n - 1$ team members abstain, just one competes against the outside bidder.

First-price and all-pay auctions

- ▶ Notation: $\Gamma^{FPA}(A, s)$, $\Gamma^{APA}(A, s)$.
- ▶ *Equilibrium with complete free riding*: $n - 1$ team members abstain, just one competes against the outside bidder.
- ▶ **Theorem**
If $\Gamma^{FPA}(A, s)$ has an equilibrium, then it is an equilibrium with complete free-riding.

First-price and all-pay auctions

- ▶ There is probability $p > 0$ that the team will send a zero bid.
- ▶ For low enough types of the outside bidder, the BR is to bid zero.
- ▶ Not an equilibrium.

The linear-proportional model

The linear-proportional model

- ▶ SPA.

The linear-proportional model

- ▶ SPA.
- ▶ Bid aggregation: $A = \sum_{i=1}^n b_i$.

The linear-proportional model

- ▶ SPA.
- ▶ Bid aggregation: $A = \sum_{i=1}^n b_i$.
- ▶ Cost sharing: $s_i = \frac{b_i}{\sum_{j=1}^n b_j}$.

The linear-proportional model

- ▶ SPA.
- ▶ Bid aggregation: $A = \sum_{i=1}^n b_i$.
- ▶ Cost sharing: $s_i = \frac{b_i}{\sum_{j=1}^n b_j}$.
- ▶ w.l.o.g: $A = \sum_{i=1}^n \psi(b_i), s_i = \frac{\psi(b_i)}{\sum_{j=1}^n \psi(b_j)}$.

The linear-proportional model

- ▶ SPA.
- ▶ Bid aggregation: $A = \sum_{i=1}^n b_i$.
- ▶ Cost sharing: $s_i = \frac{b_i}{\sum_{j=1}^n b_j}$.
- ▶ w.l.o.g: $A = \sum_{i=1}^n \psi(b_i), s_i = \frac{\psi(b_i)}{\sum_{j=1}^n \psi(b_j)}$.
- ▶ G - uniform on $[0, M]$.

The linear-proportional model

- ▶ SPA.
- ▶ Bid aggregation: $A = \sum_{i=1}^n b_i$.
- ▶ Cost sharing: $s_i = \frac{b_i}{\sum_{j=1}^n b_j}$.
- ▶ w.l.o.g: $A = \sum_{i=1}^n \psi(b_i), s_i = \frac{\psi(b_i)}{\sum_{j=1}^n \psi(b_j)}$.
- ▶ G - uniform on $[0, M]$.

▶ Theorem

Suppose that $M \geq 2n$. Then the linear-proportional model has a unique equilibrium. The equilibrium is symmetric:

$\beta_1 = \dots = \beta_n = \beta^{SPA}$, where the bid function β is given by:

$$\beta^{SPA}(\theta) = \max\{\theta - a, 0\},$$

where a is the unique solution to:

$$a = \frac{n-1}{n+1} \cdot \left(\int_a^1 tf(t)dt + aF(a) \right).$$

Properties, interpretation

Properties, interpretation

$$\beta^{SPA}(\theta) = \max\{\theta - a, 0\},$$

Properties, interpretation

$$\beta^{SPA}(\theta) = \max\{\theta - a, 0\},$$

- ▶ If $n = 1$ then $a = 0$: the weak dominance equilibrium of the standard (IPV) second-price auction.

Properties, interpretation

$$\beta^{SPA}(\theta) = \max\{\theta - a, 0\},$$

- ▶ If $n = 1$ then $a = 0$: the weak dominance equilibrium of the standard (IPV) second-price auction.

▶ Proposition

In the linear-proportional model, the equilibrium-expected-utility of a team member with type θ is:

$$\pi^*(\theta) = \frac{1}{2M} \cdot [2\theta - \max\{\theta - a, 0\}] \cdot [2a + \max\{\theta - a, 0\}].$$

Properties, interpretation

$$\beta^{SPA}(\theta) = \max\{\theta - a, 0\},$$

- ▶ If $n = 1$ then $a = 0$: the weak dominance equilibrium of the standard (IPV) second-price auction.

▶ Proposition

In the linear-proportional model, the equilibrium-expected-utility of a team member with type θ is:

$$\pi^*(\theta) = \frac{1}{2M} \cdot [2\theta - \max\{\theta - a, 0\}] \cdot [2a + \max\{\theta - a, 0\}].$$

- ▶ The team size n and type. dist. F only affects the cutoff a .

The cutoff

The cutoff

- ▶ a_n = the cutoff a corresponding to a bidding team of size n .

The cutoff

▶ a_n = the cutoff a corresponding to a bidding team of size n .

▶ Proposition

The cutoff a_n satisfies the following:

1. a_n is strictly increasing in n .
2. $\lim_{n \rightarrow \infty} a_n = 1$.
3. $(\frac{n-1}{n+1})\mathbb{E}(\theta) \leq a_n$ for all $n \geq 1$.

The cutoff

▶ a_n = the cutoff a corresponding to a bidding team of size n .

▶ Proposition

The cutoff a_n satisfies the following:

1. a_n is strictly increasing in n .
2. $\lim_{n \rightarrow \infty} a_n = 1$.
3. $(\frac{n-1}{n+1})\mathbb{E}(\theta) \leq a_n$ for all $n \geq 1$.

▶ Proposition

Consider two copies of the model—one in which the type distribution is F and one in which it is G , where F first-order stochastically dominates G . Let a^z be the cutoff corresponding to $z \in \{F, G\}$. Then $a^F \geq a^G$.

► Proposition

Consider the linear-proportional model under the second-price format, and let the regular bidder's type be uniform on $[0, M]$, where $M \geq 2n$. Then the team's equilibrium expected bid, $n \times \mathbb{E}(\beta^{SPA})$, is increasing in n .

First-price and all-pay

First-price and all-pay

► Proposition

If F and G are both uniform over $[0, 1]$ and the auction-format is all-pay, then the linear-proportional model has equilibria with complete free riding.

First-price and all-pay

► Proposition

If F and G are both uniform over $[0, 1]$ and the auction-format is all-pay, then the linear-proportional model has equilibria with complete free riding.

► Proposition

If F and G are both uniform over $[0, 1]$ and the auction-format is first-price, then the linear-proportional model has no equilibrium with complete free riding. Therefore, it has no equilibrium.

Future research

Future research

- ▶ Not an exogenous mechanism (A, s); instead, within-team negotiation;
